Answers

- 1. (a) i. $\exists y \ p(y) \lor [\exists y \ (q(y) \to (\exists x \ (p(x) \lor \ q(x,y,C)))]$
 - ii. $\exists y \ p(y) \lor [\exists y \ (\neg q(y) \lor (\exists x \ (p(x) \lor \ q(x,y,C)))] \to \text{replacement}$
 - iii. $\exists y \ p(y) \lor [\exists z \ (\neg q(z) \lor (\exists x \ (p(x) \lor \ q(x,z,C)))]$ standardizing variables
 - iv. $p(A) \vee \neg q(F(z)) \vee p(G(x)) \vee q(G(x), F(z), C)$ skolemize \exists to constants and functions
 - v. $[[[p, A], [\neg, q, F(z)], [p, G(x)], [q, G(x), F(z), C]]]$ Pythonic Representation
 - (b) i. $\forall x \forall y \forall x \ d(x,y) \land d(y,z) \rightarrow d(x,z)$
 - ii. $\forall x \forall y \forall x \ d(x,y) \land \neg d(y,z) \lor d(x,z) \rightarrow \text{elimination}$
 - iii. $d(x,y) \wedge \neg d(y,z) \vee d(x,z)$ drop universal quantifiers
 - iv. $(d(x,y) \vee d(x,z)) \wedge (\neg d(y,z) \vee d(x,z))$ distribute \vee over \wedge
 - v. $[[[d,x,y],[d,x,z]],[[\neg,d,y,z],[d,x,z]]]$ Pythonic Representation
 - (c) i. $(P \vee Q) \wedge (\neg P \rightarrow (Q \vee R))$
 - ii. $(P \vee Q) \wedge (P \vee Q \vee R) \rightarrow \text{elimination and double negation}$
 - iii. [[P], [Q], [P], [Q], [R]] Pythonic Representation
- 2. (a) True. $m(1,1) \wedge m(2,1) \wedge m(3,2)$ is true, so the universal quantifier is true in all possible values of 'x'.
 - (b) False. There is no ordered pair in the set of m ordered pairs such that the number 3 is the second element in the ordered pair, thus not all instances of the $\forall x$ are true.
 - (c) False. In the languages I am aquainted with, x is not a free variable, so this is syntactically incorrect. Moreover, if it were correct syntactically, we would apply the rules by the main connective, so we would have something like $\exists x \ m(1,1) \land \exists x \ m(2,2) \land \exists x \ m(3,3)$ which is also false.
 - (d) False. There is no value for x such that it is the first component of every ordered pair in the set of ordered pairs m.
 - (e) False. There is no value for x such that it is the second component of every ordered pair in the set of ordered pairs m.
 - (f) True. Again, see note for c. Here, $\exists x$ is our main connective, so we get $\forall x \ m(1,1) \lor \forall x \ m(2,2) \lor \forall x \ m(3,3)$ and this is true since m(1,1) is true.

- 3. (a) True. One in three times p(x) evaluates to false, and two in three times it is true. So, it is exactly twice as often.
 - (b) True. Expands out to $Mym(y,1) \to p(1) \land Mym(y,2) \to p(2) \land Mym(y,3) \to p(3)$
- 4. The domain is not specified, so I will assume the domain is the set of dogs Ursala, Kaiser, and Shilah. In plain English, the FOL sentence states that there is some dog, call that dog x, and another dog, call that dog y. x is gray and y is silver, and x loves y. In order to do resolution refutation, we must convert the sentence to CNF or clausal form. Additionally, we'll need to translate our three premises into the formal language. Since we have the three dogs, we'll need an individual constant for each one.

Interpretation (Constants and Domain)

```
Domain = \{Ursala, Kaiser, Shilah\}
```

U = Ursala

K = Kaiser

S = Shilah

Premises (converted to FOL then to CNF)

- silver(U)a.
- $gray(S) \wedge loves(S, K)$ b.
- 1. $\neg (qray(K) \leftrightarrow silver(K)) \land loves(K, U)$
 - 2. $(gray(K) \land \neg silver(K)) \lor (silver(K) \land \neg gray(K)) \land loves(K, U) \leftrightarrow equivalence rule$

Conclusion (converted to CNF)

```
\exists x \exists y (gray(x) \land silver(y) \land loves(x, y))
```

 $\exists y (gray(F(x)) \land silver(y) \land loves(F(x), y))$ Skolemize or bind $\exists x$ to skolem function F(x) $gray(F(x)) \wedge silver(G(y)) \wedge loves(F(x), G(y))$ Skolemize or bind $\exists y$ to skolem function G(y)

Resolution

- silver(U)Premise 1. 2. $gray(S) \wedge loves(S, K)$ Premise 3. $(gray(K) \land \neg silver(K)) \lor (silver(K) \land \neg gray(K)) \land loves(K, U)$ Premise $\neg (qray(F(x)) \land silver(G(y)) \land loves(F(x), G(y)))$ Conclusion 4. $\neg gray(F(x)) \lor \neg silver(G(y)) \lor \neg loves(F(x), G(y))$ from 4 5.
- $silver(U) \land (\neg qray(F(x)) \lor \neg silver(G(y)) \lor \neg loves(F(x), G(y)))$ 6.
- Addition on lines 1, 5 7.
- $silver(U) \land (\neg gray(F(x)) \lor \neg silver(U) \lor \neg loves(F(x), U))$ Let G(y) = U and substitute
- 8. $(silver(U) \land \neg gray(Fx)) \lor (silver(U) \land loves(F(x), U) \lor$ Distribute \land over \lor $(silver(U) \land \neg silver(U))$
- 9. $(silver(U) \land \neg gray(Fx)) \lor (silver(U) \land loves(F(x), U))$ Resolve the last disjunct
- 10.

5. Interpretation (Constants and Domain)

```
Domain = All Objects

pushable(x) = x is pushable

red(x) = x is red

green(x) = x is green

C = Object1 (A cart)

O = Object2 (A pile of ore)
```

Translations

- (a) If pushable objects are green, the non-pushable are red.
 - i. $\forall x(pushable(x) \rightarrow green(x)) \rightarrow \forall y(\neg pushable(y) \rightarrow red(y))$ FOL
 - ii. $\exists x(pushable(x) \land \neg green(x)) \lor \forall y(pushable(y) \lor red(y)) \rightarrow \text{elimination and } \neg \neg \text{ elimination}$
 - iii. $(pushable(G(x)) \land \neg green(G(x)) \lor pushable(y) \lor red(y)$ Drop $\forall y$ and skolemize $\exists x$ with G(x)
 - iiii. $[[[[pushable, G(x)], [\neg, green, G(x)]], [pushable, y], [red, y]]]$ Pythonic Representation
- (b) All objects are either green or red.
 - i. $\forall x (green(x) \lor red(x))$ FOL
 - ii. $green(x) \lor red(x)$ CNF
 - iii. [[[green, x], [red, x]]] Pythonic Representation

*This problem does not state exclusivity of red and green objects

- (c) Object 1, a cart, is pushable.
 - i. pushable(C) FOL and CNF
 - ii. [[pushable, C]] Pythonic Representation
- (d) Object 2, a pile of ore, is not pushable.
 - i. $\neg pushable(O)$ FOL and CNF
 - ii. [[pushable, O]] Pythonic Representation

$Resolution\ Refutation$

- i. $\neg \exists x (red(x))$
- ii. $\neg red(x)$
- $\begin{array}{ll} \text{iii.} & [[pushable, O], [pushable, C], [[green, x], [red, x]], \\ & [[[pushable, G(x)], [\neg, green, G(x)]], [pushable, y], [red, y]], [\neg, red, x]] \end{array}$

 \neg Conclusion

Drop universal quantifier Premises and Conclusion
